

This map displays suitable locations for a new training center in Clarke-County, GA. The soil data is downloaded from Toxic Release Inventory and the county data from U.S. Census Bureau. This map exemplifies the raster overlay tool which combines data from multiple layers into one layer for a more complex analysis. The map layout also contrasts the weighted and unweighted maps, showing how weighing layers with various levels of importance can impact the results. The map was created in October, 2017.
